

Case Study – AquaTray – Leak Barrier Ceilings

Case Study – East Coast Client

A principle subsidiary of a Fortune 1000 company, which provides energy and natural gas services required approximately 750 square foot of leak protection for its data center. The company used a heavy duty data center ceiling grid for the majority of the project. The AquaTray® system was configured of primarily drainage trays and a few flat panels. Clean room lighting fixtures and sprinkler boots were used to ensure leak integrity for these ceiling elements.

The photo shows the project under construction.

AquaTray LLC is the market developer and industry leader in a new class of commercial ceiling system – the **Leak Barrier Ceilings**. Now there is a way to provide a pre-engineered solution to the common problem of overhead leak threats. The AquaTray® system meets interior building codes and standards and provides the level of quality that you demand in your designs and installations. When properly designed and installed the system provides protection from a sizable leak that is ready 24/7/365. The AquaTray® system provides true **protection and not just detection** in the event of an overhead leak.
